Week 2

Individual Status Report – Week 2

Previous Week's Goals

We plan on figuring out the use cases and other relevant documentation for our project. Collectively we need to figure out who will do which goal and which goals will be shared. One of the main things I will work on is creating the team website. This includes creating the html and css and uploading it to the student server. I also plan on assisting the team with the process description and participating in the custom meeting with the other group.

Previous Week's Progress

We finished the software requirements specification which included all of these things. I created the whole website and was able to add the documents as we completed them. We collectively worked on all the documents but I was able to attend both customer meetings and write about the concerns that the other team raised.

This Week's Goals

This week we need to actually start creating the implementation of our project. We need to get used to the Type Checker Framework and see what the limitations are for our checker. For this we need to create the trivial checker, the even/odd checker. I am planning to do most of the coding for this, even though that it is not that much. I will also help design the software design specification once we figure out how and what we will do with our checker.
